This site provides information on the most common server and networking issues facing IT Professionals. Google Sketchup is a free (as in beer) application designed to let you design 3D models and view them from almost any computer. Check this out for best setup: Windows 7 Pro x64, Dual monitor, Wacom Cintiq 24HD, Dell U2410 LCD Monitor, Lenovo G700 Gaming Notebook, Graphics card: nVidia GTS250. Everything is configured using W7's Control Panel, on one of my monitors, connected to my laptop via a VGA to HDMI cable. All settings are done on the laptop. These settings: 1) control what programs are active 2) control the resolution 3) control the display mode (dual head and so on) 4) control when power is turned on and off (power management) 5) control sound volume, music, etc 6) place system tray icons to where they belong 7) turn screen saver on or off 8) access the settings menu via the Windows key 9) Windows key + X to close a window All you need to do is: 1) download the Google Sketchup files from Google 2) open the program and point the mouse to the red arrow, this opens the menu for new file, open, new project,... 3) enter your setting and click ok 4) When you are happy with your settings (in the menus) go to the file menu and save 5) When the files are saved, everything is ready You can also drag and drop things from the google sketchup file on to your desktop to save them. From there you can also print to a HP LaserJet 1201, and save the.pdf files to your desktop as well. Note: you can open the GDBM.exe file and double click on it to run it. Then, open a notepad document and copy/paste the following settings in the document: 1) GDBM\_DB\_FULL\_MEMORY 2) GDBM\_DB\_NO\_SHARED\_MEMORY 3) GDBM\_DB\_NONE 4) GDBM\_DB\_INIT\_PAGES= 5) GDBM\_DB\_US 82157476af
